Proyecto is a **project management app** that is the perfect solution for any corporate and technical company setup as it integrates all of the required functionalities within a corporate setup into a single application.

We can create tasks, view project analytics, create different chat groups and also use video-conferencing.

We have two models for our app:

1. **Admin Model:** This model is for the team leader or the manager of the organization who will create projects. Within a project they can add tasks to certain employees and it will be reflected on the employee's device in real time.  
They can also review a certain task which has been completed by the employee and mark them as completed.  
Also admins can view various user analytics and project analysis, as to track the current status of the project through the admin dashboard from their profile.
2. **Employee Model:** Employees will be able to view the projects and tasks assigned to them by the admin.  
Employees themselves can assign tasks between other employees but do not have the ability to create a new project.  
When clicked on a particular project, the various tasks will be displayed to the employee with the deadline and priority.  
When the task is completed, they can send it for review to the admin.

Employees, as well as admins, can create different chat groups for different teams and departments.

They will also be able to conduct video conferences from within our app and the link is also supported to work on browsers.
